ANTERIOR CRUCIATE LIGAMENT (ACL) RECONSTRUCTION: HAMSTRING AUTOGRRAFT

Background
The following anterior cruciate ligament (ACL) reconstruction rehabilitation protocol is specific to patients with a hamstring autograft. If a patellar tendon autograft was used, please refer to the “Anterior Crucial Ligament (ACL) Reconstruction: Patellar Tendon Autograft” protocol on the OSU Sports Medicine website.

The rehabilitation recommendations below are based upon the guidance of content experts, evidence-based practice and the Multicenter Orthopaedic Outcomes Network (MOON) group. Progression through each phase is based on the patient demonstrating readiness by achieving functional criteria rather than the time elapsed from surgery. The times frames identified after each phase are approximate times for the average patient, NOT guidelines for progression.

Disclaimer
Progression is time and criterion-based, dependent on soft tissue healing, patient demographics and clinician evaluation. If you are working with an Ohio State Sports Medicine patient and questions arise, please call 614-293-2385.
# Summary of Recommendations

## Precautions

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>No testing of repaired or reconstructed ligaments (Lachman, Anterior/Posterior Drawer, Varus/Valgus Stress) prior to 12 WEEKS</td>
</tr>
<tr>
<td>2.</td>
<td>No isotonic resisted hamstring exercises for 8 WEEKS with hamstring autograft</td>
</tr>
<tr>
<td>3.</td>
<td>No loaded open kinetic chain knee extension beyond 45 degrees for 8 WEEKS</td>
</tr>
</tbody>
</table>
| 4. | Meniscus Repair: *Always refer to operative note or reach out to surgical team for clarification (general precautions below)*  
   a. No weight-bearing (WB) therapeutic exercise >90° x 8 WEEKS  
   b. PWB x4 WEEKS  
   c. No forced flexion beyond 90° x 4 WEEKS |

## Outcome Tools

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Collect the Lower Extremity Functional Scale (LEFS) at each visit</td>
<td></td>
</tr>
</tbody>
</table>
| Consider collecting one of the following outcome tools at initial evaluation, monthly and discharge. Be consistent with which outcome tool is collected each time.  
   1. IKDC  
   2. KOOS |
| You may choose to include ACL-RSI, Tegner or other questionnaires specific to your patient’s needs. |

## Strength Testing

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Isometric testing anytime- fixed at 90°</td>
</tr>
<tr>
<td>2.</td>
<td>Isokinetic testing no earlier than 12 weeks</td>
</tr>
</tbody>
</table>

## Criteria to Discharge Assistive Device

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>ROM: Full active knee extension; no pain on passive overpressure</td>
</tr>
<tr>
<td>2.</td>
<td>Strength: Able to perform strong quad isometric with full tetany and superior patellar glide and able to perform 2x10 SLR without quad lag</td>
</tr>
<tr>
<td>3.</td>
<td>Effusion: 1+ or less is preferred (2+ acceptable if all other criteria are met)</td>
</tr>
<tr>
<td>4.</td>
<td>Weight Bearing: Demonstrates pain-free ambulation without visible gait deviation</td>
</tr>
</tbody>
</table>

## Criteria to Initiate Running and Jumping

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>ROM: full, pain-free knee ROM, symmetrical with the uninvolved limb</td>
</tr>
<tr>
<td>2.</td>
<td>Strength: Isokinetic testing 80% or greater for hamstring and quad at 60°/sec and 300°/sec (<a href="#">Appendix D</a>)</td>
</tr>
<tr>
<td>3.</td>
<td>Effusion: 1+ or less</td>
</tr>
<tr>
<td>4.</td>
<td>Weight Bearing: normalized gait and jogging mechanics</td>
</tr>
<tr>
<td>5.</td>
<td>Neuromuscular Control: Pain-free hopping in place</td>
</tr>
</tbody>
</table>

## Criteria for Return to Sport

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>ROM: full, pain-free knee ROM, symmetrical with the uninvolved limb</td>
</tr>
<tr>
<td>2.</td>
<td>Strength: Isokinetic testing 90% or greater for hamstring and quad at 60°/sec and 300°/sec (<a href="#">Appendix D</a>)</td>
</tr>
<tr>
<td>3.</td>
<td>Effusion: No reactive effusion ≥ 1+ with sport-specific activity</td>
</tr>
<tr>
<td>4.</td>
<td>Weight Bearing: normalized gait and jogging mechanics</td>
</tr>
<tr>
<td>5.</td>
<td>Neuromuscular control: appropriate mechanics and force attenuation strategies with high level agility, plyometrics, and high impact movements</td>
</tr>
<tr>
<td>6.</td>
<td>Functional Hop Testing: LSI 90% or greater for all tests (<a href="#">Appendix E</a>)</td>
</tr>
<tr>
<td>7.</td>
<td>Physician Clearance</td>
</tr>
</tbody>
</table>
## RED/YELLOW FLAGS

Red flags are signs/symptoms that require immediate referral for re-evaluation. Yellow flags are signs/symptoms that require modification to plan of care.

<table>
<thead>
<tr>
<th>Red Flags</th>
<th>Require immediate referral for re-evaluation</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Signs of DVT → Refer directly to ED</td>
</tr>
<tr>
<td></td>
<td>- Localized tenderness along the distribution of deep venous system</td>
</tr>
<tr>
<td></td>
<td>- Entire LE swelling</td>
</tr>
<tr>
<td></td>
<td>- Calf swelling &gt;3cm compared to asymptomatic limb</td>
</tr>
<tr>
<td></td>
<td>- Pitting edema</td>
</tr>
<tr>
<td></td>
<td>- Collateral superficial veins</td>
</tr>
<tr>
<td></td>
<td>• Lack of full knee extension by 4 weeks post-op → Refer to surgeon for re-evaluation</td>
</tr>
<tr>
<td></td>
<td>• Mechanical block or clunk → Refer to surgeon for re-evaluation</td>
</tr>
<tr>
<td></td>
<td>• Reported episode of instability → Refer to surgeon for re-evaluation</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Yellow Flags</th>
<th>Require modifications to plan of care</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Persistent reactive effusion or pain following therapy or ADLs</td>
</tr>
<tr>
<td></td>
<td>- Decrease intensity of rehab interventions, continue effusion management, educate patient regarding activity modifications until symptoms resolve</td>
</tr>
</tbody>
</table>

### Protection Phase (Post-ACLR – 4 weeks)

#### Appointments

Goal: Restore ROM, minimize effusion and pain. Post-operative evaluation should be performed 3-5 days following surgery. Follow-up appointments 1-2x per week, depending on progression towards goals.

#### Precautions

1. No testing of repaired or reconstructed ligaments (Lachman, Anterior/Posterior Drawer, Varus/Valgus Stress) prior to 12 WEEKS
2. No loaded open kinetic chain knee extension beyond 45° for 8 WEEKS
3. Meniscus Repair: Always refer to operative note or reach out to surgical team for clarification (general precautions below)
   a. No weight-bearing (WB) therapeutic exercise >90° x 8 WEEKS
   b. PWB x4 WEEKS
   c. No forced flexion beyond 90° x4 WEEKS

#### Pain and Effusion

≥ 2+ (using Modified Stroke Test)
Cryotherapy and compression (ie. Donut, ace wrap, limited WB therapeutic exercise)

#### ROM

**Extension:** Emphasis on achieving full knee extension immediately following surgery. Utilize low load, long duration stretching – See Appendix A. If full extension is not achieved by 4 weeks, contact surgeon regarding ROM concerns.

**Flexion:** No forced flexion past 90° for meniscus repairs. ACLR and meniscectomy are able to push for symmetrical flexion as appropriate.

#### Therapeutic Exercise

- Emphasis on quad activation without gluteal co-contraction
- Restore patellar mobility
- Symmetrical ROM
- Decrease effusion
- Ambulation with appropriate joint loading and without obvious gait deviation

#### Suggested Interventions

- Extension ROM: bag hangs or prone hangs (Appendix A)
- Flexion ROM: heel slides, wall slides, upright bike
- Patellar mobilization: superior, inferior, medial, lateral
- Quad Isometrics; SLR 4-way
- TKE: prone and standing
- Weight shifting, SL balance
- Neuromuscular re-education using electrical stimulation (NMES) at 60° knee flexion *(Appendix B)*

| NMES Parameters *(Appendix B)* | • NMES pads are placed on the proximal and distal quadriceps  
| | • Patient: Seated with the knee in at least 60° flexion, shank secured with strap and back support with thigh strap preferred. The ankle pad/belt should be two finger widths superior to the lateral malleoli  
| | • The patient is instructed to relax while the e-stim generates at least 50% of their max volitional contraction against a fixed resistance OR maximal tolerable amperage without knee joint pain  
| | • 10-20 seconds on/ 50 seconds off x 15 min |

| Criteria to Discharge Assistive Device | 1. ROM: Full active knee extension; no pain on passive overpressure  
| | 2. Strength: Able to perform strong quad isometric with full tetany and superior patellar glide and able to perform 2x10 SLR without quad lag  
| | 3. Effusion: 1+ or less is preferred (2+ acceptable if all other criteria are met)  
| | 4. Weight Bearing: Demonstrates pain-free ambulation without visible gait deviation |

| Criteria to Progress to Early Loading Phase | ROM: ≥ 0-120 degrees  
| | Strength: Quadriceps set with normal superior patellar translation, SLR x 10 seconds without extensor lag  
| | Goals: (These do not limit progression to next phase; however, should be addressed with interventions)  
| | Effusion: 2+ or less with Modified stroke test  
| | Weight Bearing: Able to tolerate CKC therex program without increased pain and ≥≤ 2+ effusion |

**Early Loading Phase (4-8 weeks)**

| Appointments | Goal: to improve LE loading symmetry, increase strength and normalize gait mechanics.  
| | 1-2 visits per week with emphasis on HEP compliance (2-3 days per week outside of therapy). |

| Precautions | Open Chain knee extension:  
| | • Initiate unresisted LAQ at 4 weeks (partial → full range)  
| | • Initiate multi-angle isometrics at 4 weeks  
| | • Begin isotonic open chain knee extensions through protected ROM (90-45°) at 6 weeks  
| | No isolated resisted hamstrings strengthening until 8 weeks |

| Pain and Effusion | Cryotherapy/compression as needed for reactive effusion.  
| | Patellar taping to reduce PF symptoms if present |

| ROM | • Monitor and progress knee ROM, patellar mobility, and LE flexibility  
| | • Continue bike for ROM and warm up  
| | • Begin more aggressive techniques to achieve/maintain full knee extension (i.e. weighted bag hang) as needed  
| | • If full AROM knee extension is not achieved by 4 weeks, contact surgeon regarding ROM concerns. |

| Suggested Interventions and timelines | • Multi-angle knee isometrics from 90-60°  
| | • Initiate open chain knee extension exercises  
| | o Initiate unresisted LAQ at 4 weeks (partial → full range)  
| | o Begin isotonic open chain knee extensions through protected ROM (90-45°) at 6 weeks  
| | • Progress WB quadriceps exercises with emphasis on proper LE mechanics (no isolated HS strengthening until 8 weeks) |
• Progress gluteal and lumbopelvic strength and stability
• Progress single leg balance
• Endurance: low impact - treadmill walking, stepper, elliptical (6 weeks)
• NMES (see parameters in week 1-4)

Criteria to d/c NMES
• <20% quadriceps deficit on isometric testing
OR- If a Biodex machine in not available:
  1. 10 SLR without quad lag
  2. Normal gait
  3. 10 heel taps to 60 degrees with good quality
  4. 10 rep max on LP and similar effort bilaterally
  5. Inability to break quad MMT

Criteria to Progress to Strength and Power Phase

1. ROM: Maintain full, pain free AROM including PF mobility
2. Effusion: 1+ or less
3. Strength: See criteria to discharge NMES
4. Weight Bearing: Able to tolerate therapeutic exercise program without increased pain or >1+ effusion
5. Neuromuscular Control: Demonstrates proper lower extremity mechanics with all therapeutic exercises (bilaterally)

Strength and Power Phase (8-12 weeks)

Appointments
Goal to increase lower extremity strength and power.
1-2 visits per week with emphasis on patient compliance with resistance training as part of HEP (2-3 days per week outside of therapy).

Precautions
Open Chain knee extension:
• Resisted open chain knee extension (protected ROM → full ROM)

Pain and Effusion
Cryotherapy/compression as needed for reactive effusion.
Patellar taping to reduce PF symptoms if present

ROM
• Monitor and progress knee ROM, patellar mobility, and LE flexibility
  o Continue end-range ROM interventions as needed
  o Contact surgical team regarding ROM concerns
• Consider higher level warm ups including bike sprints or versaclimber

Suggested Interventions and timelines
• Multi-angle knee isometrics from 90-0°
• Progress isotonic open chain knee extensions through full range (90-0°)
• Initiate isolated hamstring interventions at 8 weeks
  o RDL
  o Physioball hamstring curl
  o Hamstring curl machine
• Progress gluteal and lumbopelvic strength and stability
• Progress single leg balance
• Initiate PWB plyometrics on shuttle (starting at 10 weeks if a “quiet knee” is observed – full ROM, controlled effusion)
  o Light weight (0-1.5 cords) – emphasis on mechanics only
• NMES if appropriate (see parameters in week 1-4)
### Criteria to initiate Running and Jumping

1. **ROM**: full, pain-free knee ROM, symmetrical with the uninvolved limb
2. **Strength**: isokinetic testing 80% or greater for hamstring and quad at 60º/sec and 300º/sec *(See Appendix C and D)*
3. **Effusion**: 1+ or less
4. **Weight Bearing**: normalized gait and jogging mechanics
5. **Neuromuscular Control**: Pain-free hopping in place (DL and SL hops in place)

### Criteria to Progress to Return to Function Phase

6. **ROM**: Maintain full, pain free AROM including PF mobility
7. **Effusion**: 1+ or less
8. **Strength**: Isometric or isokinetic quadriceps and hamstrings strength >/= 80%
9. **Weight Bearing**: Able to tolerate therapeutic exercise program, including jogging progression, without increased pain or >1+ effusion
10. **Neuromuscular Control**: Demonstrates proper lower extremity mechanics with all therapeutic exercises (bilaterally)
11. **Outcome Tools**: >/=7/10 on #10 IKDC Questionnaire

### Return to Function Phase (12 weeks-Return to Sport)

#### Appointments
Increased frequency from previous stage to initiate plyometric training and return to running program.

#### Precautions
Criteria to initiate hopping
- Full, pain free ROM
- ≤ 1+ effusion
- ≥ 7 /10 on #10 IKDC Questionnaire
- ≥ 80% isokinetic strength symmetry (hamstrings and quadriceps) OR ≥ 80% limb symmetry on acceptable isokinetic alternative *(See Appendix D)*

Criteria to initiate jogging (in addition to above criteria)
- Hop downs with appropriate landing mechanics
  - DL (starting at 6-8” and progressing per patient’s tolerance) → SL (starting at 2-4” and progress per patient’s tolerance)
- Audible rhythmic strike patterns and no gross visual compensation

#### Pain and Effusion
Effusion may increase with increased activity, ≤1+ and/or non-reactive effusion for progression of plyometrics

#### ROM
Full, symmetrical to contralateral limb, and painfree with overpressure

#### Therapeutic Exercise
- Performance of the quadriceps, hamstrings and trunk dynamic stability
- Muscle power generation and absorption via plyometrics
- Sport- and position-specific activities
- Begin agility exercises between 50-75% effort (utilize visual feedback to improve mechanics as needed)
- Advance plyometrics: Bilateral to single leg, progress by altering surfaces, adding ball toss, 3D rotations, etc.

#### Suggested Interventions
Therapeutic Exercise/Neuromuscular Re-education
- Squats, leg extension, leg curl, leg press, deadlifts, lunges (multi-direction), crunches, rotational trunk exercises on static and dynamic surfaces, monster walks, PWB to FWB jumping
- Single-leg squats on BOSU with manual perturbation to trunk or legs, Single-leg BOSU balance, single-leg BOSU Romanian deadlift
### Agility
- Side shuffling, Carioca, Figure 8, Zig-zags, Resisted jogging (Sports Cord) in straight planes, backpedaling

### Plyometrics
- Single-leg hop downs from increasing height (up to 12” box), Single-leg hop-holds, Double and single-leg hopping onto unstable surface, Double and single-leg jump-turns, Repeated tuck jumps

| Criteria for Return to Sport | 1. **ROM:** full, pain free knee ROM, symmetrical with the uninjured limb  
2. **Strength:** Isokinetic testing 90% or greater for hamstring and quad at 60°/sec and 300°/sec  
3. **Effusion:** No reactive effusion ≥ 1+ with sport-specific activity  
4. **Weight Bearing:** normalized gait and jogging mechanics  
5. **Neuromuscular control:** appropriate mechanics and force attenuation strategies with high level agility, plyometrics, and high impact movements  
6. **Functional Hop Testing:** LSI 90% or greater for all tests *(Appendix E)*  
7. **Physician Clearance** |
Appendix A: Bag Hang

Emphasis on low load, long duration stretching.
Goal: 60 minutes TOTAL per day (4x15 minutes, 2x30 minutes, etc)

Appendix B: NMES Set Up

2 or 4 pad set-up is appropriate
# Appendix C: Isokinetic Data Interpretation

<table>
<thead>
<tr>
<th>A</th>
<th>Peak Torque (ft-lbs)</th>
<th>Peak torque during repetitions</th>
<th>Symmetry criteria (see ‘E’ - this is the data represented in pie charts)</th>
<th>If &lt;80%; continue unilateral, high resistance strength training</th>
</tr>
</thead>
<tbody>

<td>Goal: &lt;10% asymmetry (either direction- deficit OR stronger on involved limb)</td>
<td>If &lt;80%, continue NMES in addition to strength training If &lt;90%, continue unilateral &gt; bilateral strength training emphasis</td>
</tr>
</tbody>
</table>
## Appendix D: Isokinetic Testing Alternatives

| **Isokinetic Dynamometry** | • Considered the “gold standard”  
• 60°/sec for strength and power assessment  
• 300°/second for speed and endurance assessment |
| --- | --- |
| **Hand Held Dynamometry with Static Fixation at 90°** | • Appropriate alternative  
• Results may overestimate quadriceps strength symmetry: be cautious with data interpretation |
| **SL 1RM Knee Extension Machine: 90°- 45°** | • Appropriate alternative  
• Recommended to decrease stress on PF joint and limit strain on reconstructed ACL for up to 6 months  
• Results may overestimate quadriceps strength symmetry: be cautious with data interpretation |
| **SL 1RM Leg Press** | • Fair alternative  
• Results in significant overestimation of quadriceps strength symmetry due to compensation from other LE muscle groups |
| **SL 1RM Knee Extension Machine: 90°- 0°** | • Fair alternative  
• May be uncomfortable and/or inappropriate due to PF stress |
Appendix E: Single Leg Hop Series

1) **Single hop for distance**: Have the subject line their heel up with the zero mark of the tape measure, wearing athletic shoes. The subject then hops as far as he/she can, landing on the same push off leg, for at least 3 seconds. The arms are allowed to move freely during the testing. Allow him/her to perform 2 practice hops on each leg. Then, have the subject perform 2 testing trial, recording each distance from the starting point to the back of the heel. Average the distanced hopped for each limb. The Limb Symmetry Index: Involved limb distance/Uninvolved limb distance X 100%.

2) **Cross-over hop for distance**: The subject lines their heel up with the zero mark of the tape measure and hops 3 times on one foot, crossing fully over the center line each time. Each subject should hop as far forward as he/she can on each hop, but only the total distance hopped is recorded. The arms are allowed to move freely during the testing. Allow him/her to perform 2 practice hops on each leg. Then, have the subject perform 2 testing trial, recording each distance from the starting point to the back of the heel. Average the distanced hopped for each limb. The Limb Symmetry Index: Involved limb distance/Uninvolved limb distance X 100%.

3) **Triple hop for distance**: The subject lines their heel up with the zero mark of the tape measure and hops 3 times on one foot. Each subject should hop as far forward as he/she can on each hop, but only the total distance hopped is recorded. The arms are allowed to move freely during the testing. Allow him/her to perform 2 practice hops on each leg. Then, have the subject perform 2 testing trial, recording each distance from the starting point to the back of the heel. Average the distanced hopped for each limb. The Limb Symmetry Index: Involved limb distance/Uninvolved limb distance X 100%.

4) **Timed 6-meter hop**: The subject lines their heel up at the zero mark of the tape measure and hops, on cue with the tester, as fast as they can the length of the 6-meter tape. The arms are allowed to move freely during the testing. Allow him/her to perform 2 practice hops on each leg. Then, have the subject perform 2 testing trial, recording each distance from the starting point to the back of the heel. Average the distanced hopped for each limb. The Limb Symmetry Index: Involved limb time/Uninvolved limb time X 100%.
